# Use Case Modeling

---

- Typically starts early in a project and continues throughout a system development process.
- Is usually used during **requirements activities** to capture requirements that define what a system should do.
- It is usually done in a series of sessions between users and analysts of a system.
- A use-case diagram may be considered a "**table of contents**" for the **functional requirements** of a system.
  - Elements
    - Actors
    - Use Cases
    - Relationships

# Use Case Diagram

# Actors

# Actors

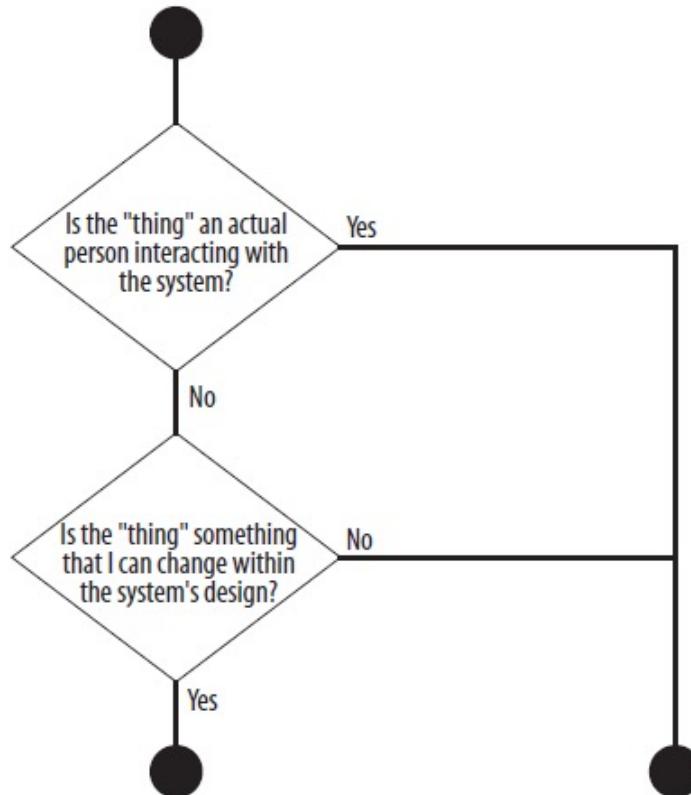

---

- An actor is a **user** or **external system** with which a system being modeled interacts.
- An actor is a **role** that a user plays with respect to the system.

# Finding Actors

Identify a "thing" from your requirements

The "thing" is *probably not* an actor.  
Anything that you can affect and have some control over when designing your system is likely to be considered a part of your system.

The "thing" is *probably* an actor.  
Be careful when it comes to people; some people can be considered part of your system.

# Finding Actors

---

- Browse through existing documents
  - noun phrases may be domain classes
  - verb phrases may be operations and associations
  - possessive phrases may indicate attributes

The ATM verifies whether the customer's card number and PIN are correct.  
If it is, then the customer can check the account balance, deposit cash, & withdraw cash.  
Checking the balance simply displays the account balance.

# From Actors

---

- Analyze each subject and object as follows:
  - Does it represent a person performing an action? Then it is an **actor**, "R"
  - Is it also a verb (such as 'deposit')? Then it may be a **method**, "M"
  - Is it a simple value, such as "colour" (string) or "money" (number)?
    - Then it is probably an **attribute**, "A"
- Which NPs are unmarked? Make them "C" for **class**

The ATM verifies whether the customer's card number and PIN are correct.  
If it is, then the customer can check the account balance, deposit cash, & withdraw cash.  
Checking the balance simply displays the account balance.

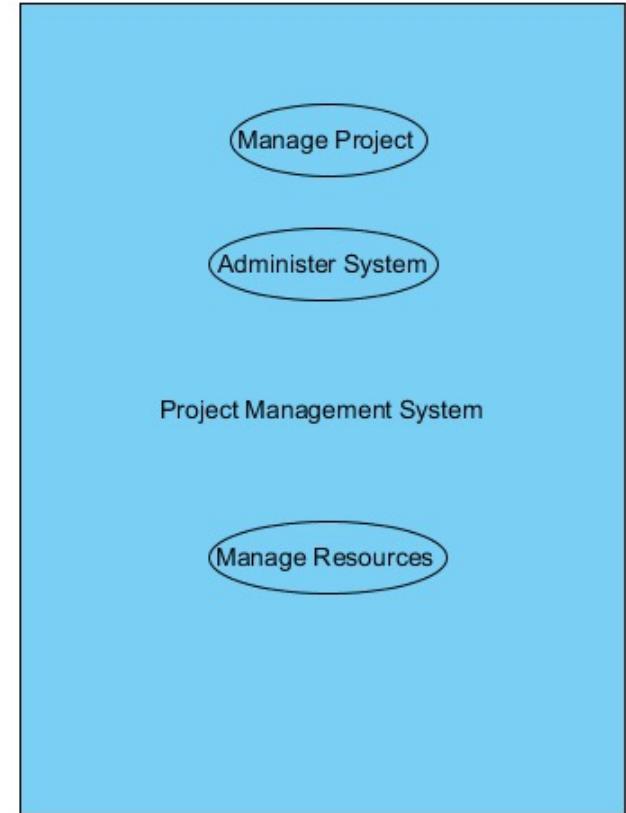

The diagram illustrates the semantic analysis of the sentence. It starts with the sentence 'The ATM verifies whether the customer's card number and PIN are correct.' Below the sentence, the analysis is shown with colored labels: S (Subject) is 'The ATM' (purple), C (Class) is 'unmarked' (green), V (Verb) is 'verifies' (green), M (Method) is 'whether' (green), O (Object) is 'the customer's card number and PIN' (blue), R (Actor) is 'customer' (blue), and A (Attribute) is 'correct' (orange). The labels are connected by lines to their respective parts of the sentence.

# Use Cases

# Use Case

---

- A use case is a **functional requirement** that is described from the **perspective of the users of a system**.
- Each use case is composed of one or more **behavior sequences**.
  - Action: processing performed by the system
  - Interaction: communication between the system and the actors

# Describing Use Case

---

- For each use case:
  - a “flow of events” document, written from an actor’s point of view
  - describes what the system must provide to the actor when the use case is executed.
- Typical contents
  - How the use case starts and ends;
  - Normal flow of events;
  - Alternate flow of events;
  - Exceptional flow of events;
- Documentation style:
  - English language description
  - Sequence Diagrams - good for detailed design
  - Activity Diagrams - good for business process

# Use Case Content

---

## Buy a Product

Main Success Scenario:

1. Customer browses catalog and selects items to buy
2. Customer goes to check out
3. Customer fills in shipping information (address, next-day or 3-day delivery)
4. System presents full pricing information
5. Customer fills in credit card information
6. System authorizes purchase
7. System confirms sale immediately
8. System sends confirmation email to customer

Extensions:

3a: Customer is Regular Customer

1. System displays current shipping, pricing and billing information
2. Customer may accept or override these defaults, returns to MSS at step 6

6a: System fails to authorize credit card

1. Customer may re-enter credit card information or may cancel

# Finding Use Cases

---

- For each actor, ask the following questions:
  - Which functions does the actor require from the system?
  - Does the actor need to read, create, destroy, modify, or store some kinds of information in the system ?
  - Does the actor have to be notified about events in the system?
  - Does the actor need to notify the system about something?
  - Could the actor's daily work be simplified or made more efficient through new functions provided by the system?

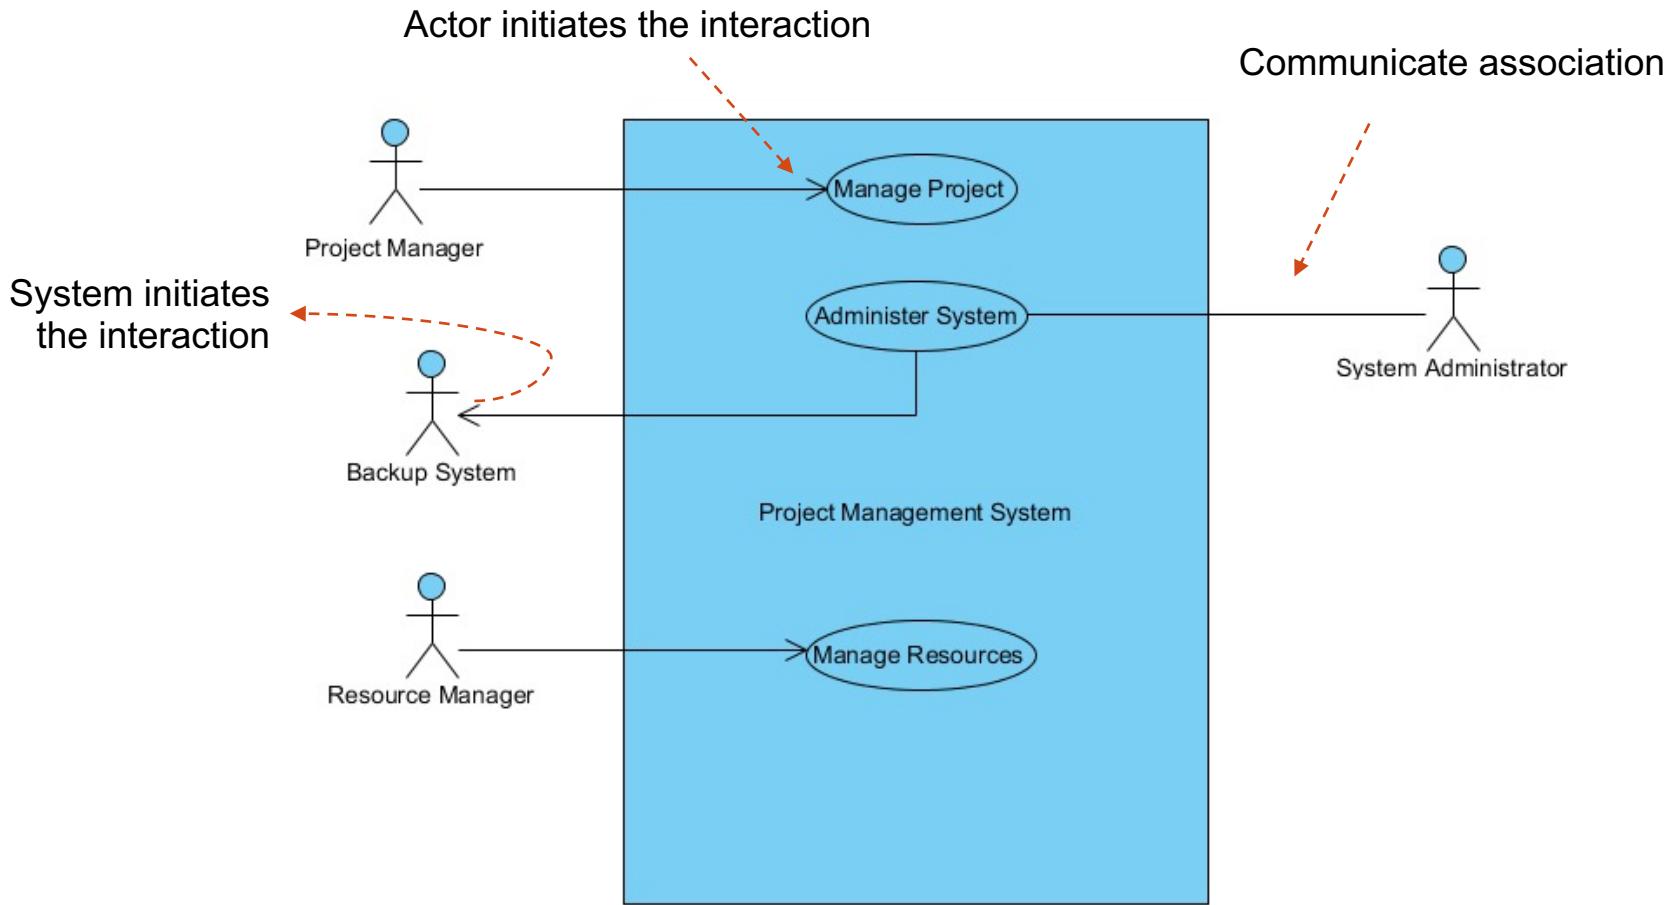

# Relationships

# Relationships

---

- Relationships in Use Case Diagram
  - Communicate Association
  - Dependency
    - Include
    - Extend
  - Generalization
    - Actor Generalization
    - Use Case Generalization

# Communicate Association

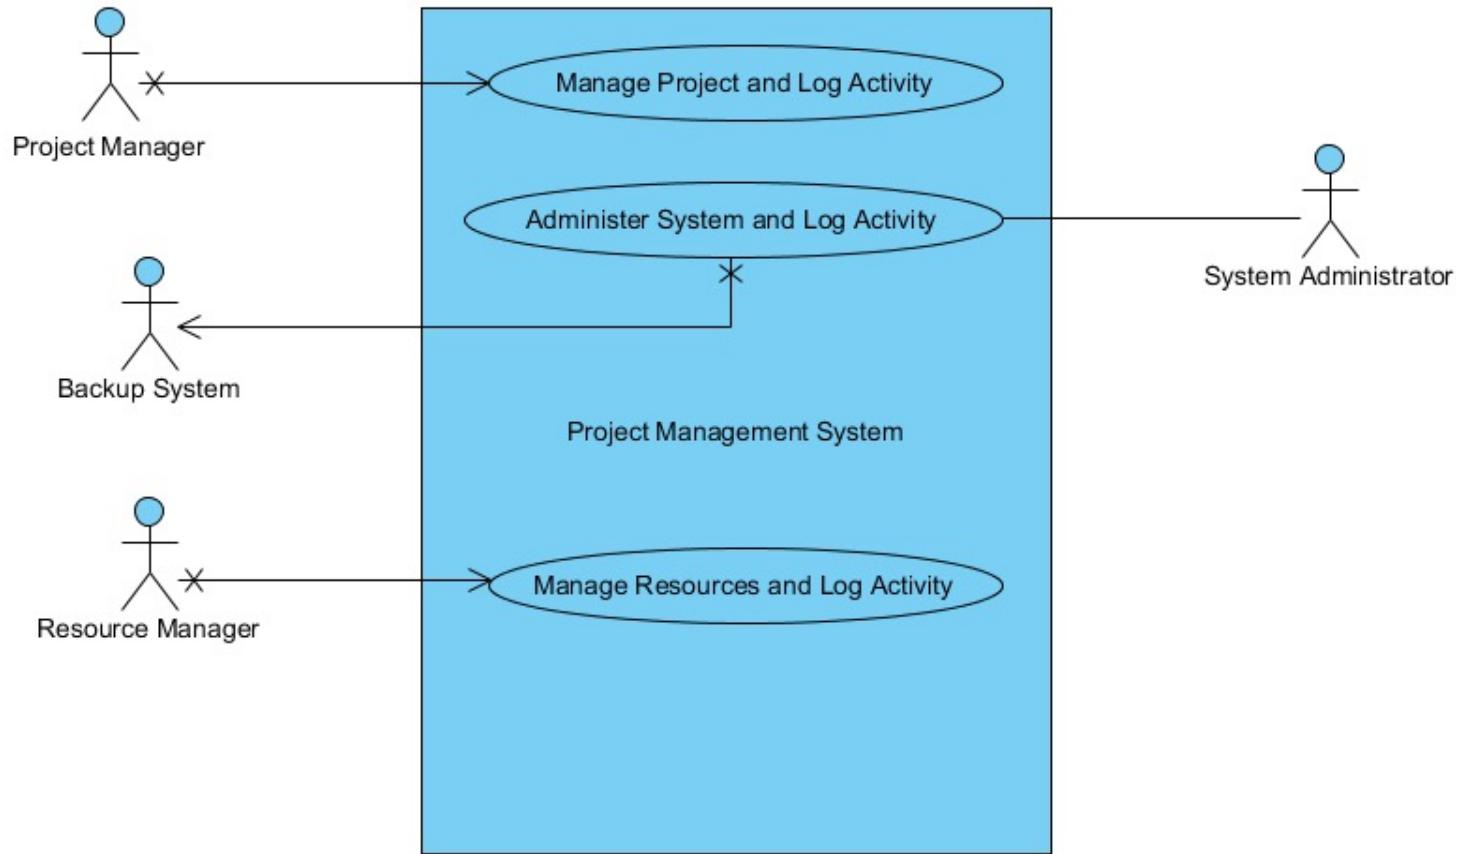

# Dependency

---

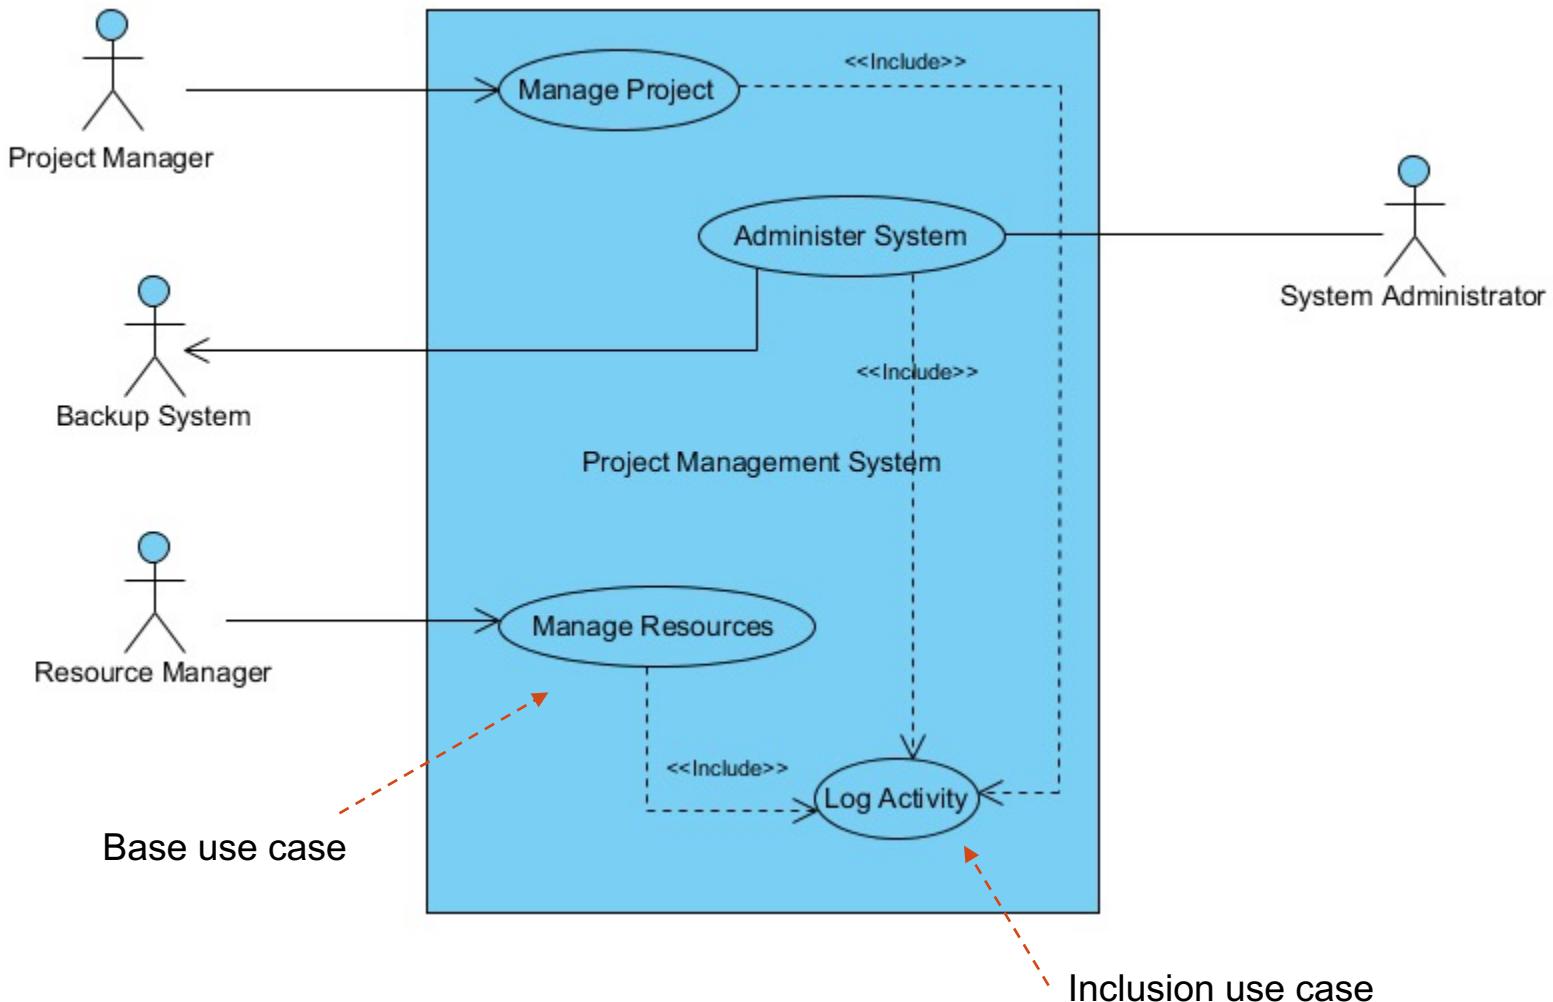

- An **include** dependency from one use case (called the base use case) to another use case (called the inclusion use case) indicates that the **base use case will include or call the inclusion use case.**
- An **extend** dependency from one use case (called the extension use case) to another use case (called the base use case) indicates that the **extension use case will extend (or be inserted into) and augment the base use case.**

# Dependency :: Include

Log activity is common to these three use cases

# Dependency :: Include

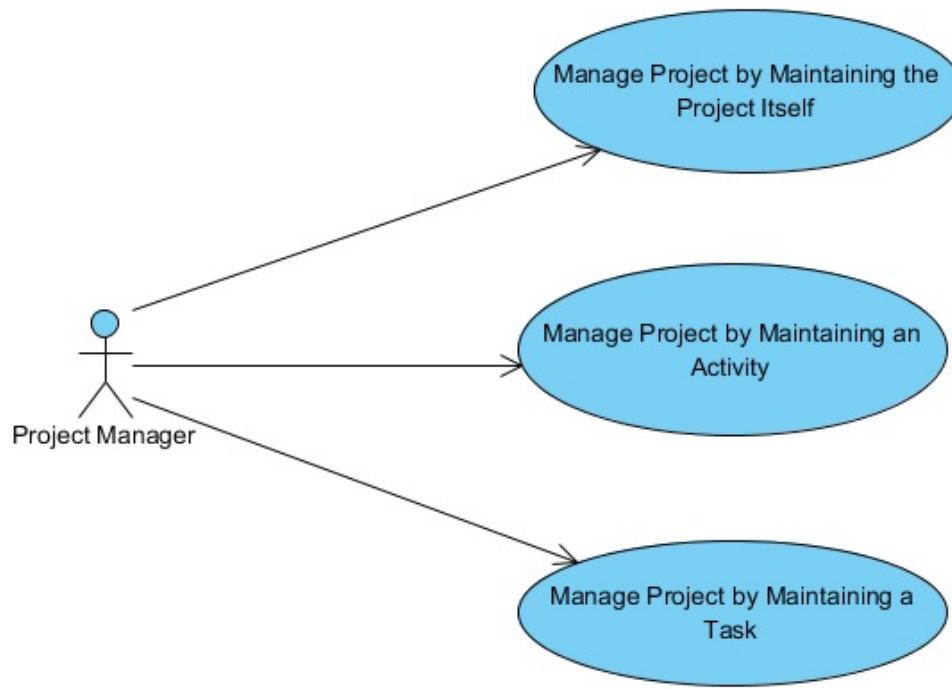

# Dependency :: Include

---

- The importance of **reuse** in use case diagram by using include dependency:
  - Reduces redundancy between use case descriptions
  - Removes the need for tedious copy-and-paste operations between use case descriptions, since updates are made in only one place instead of every use case.
  - Gives you a good indication at system design time that the implementation of an inclusion use case will need to be a reusable part of your system

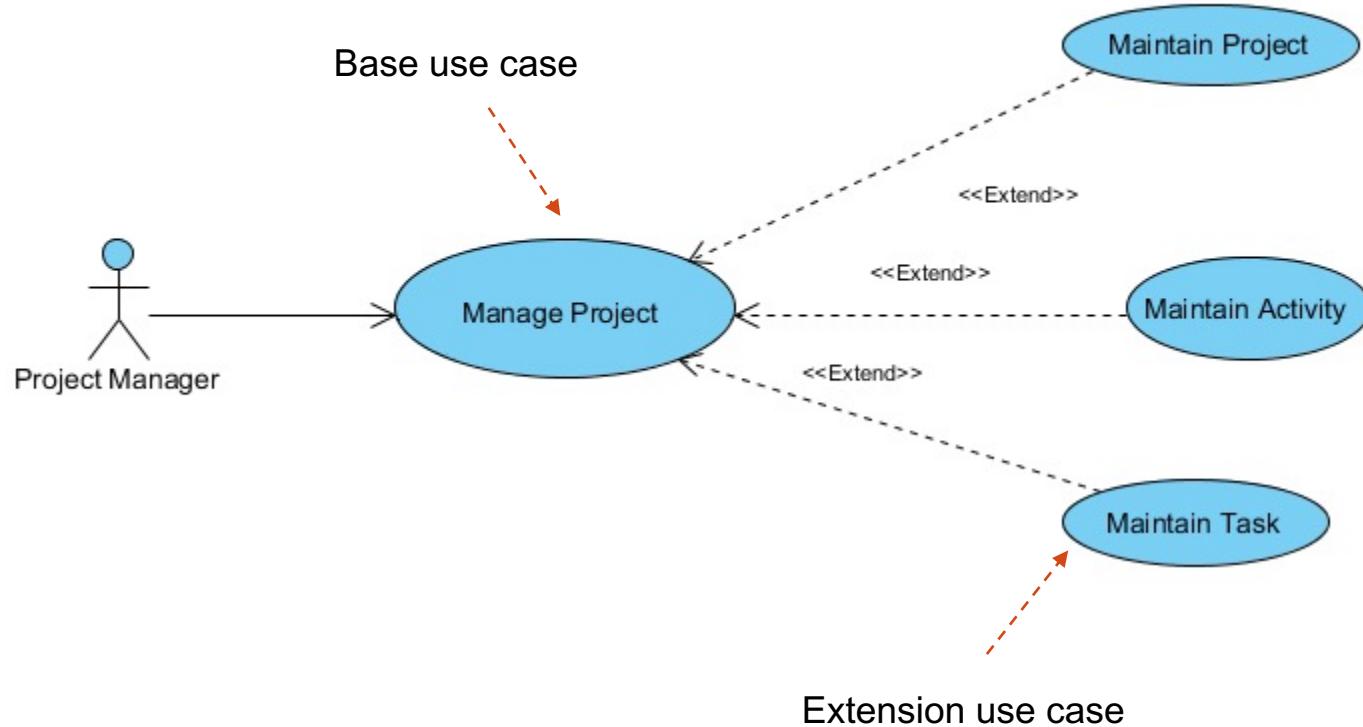

# Dependency :: Extend

---

Maintaining the project, its activities, and its tasks are options of managing a project.

# Dependency :: Extend

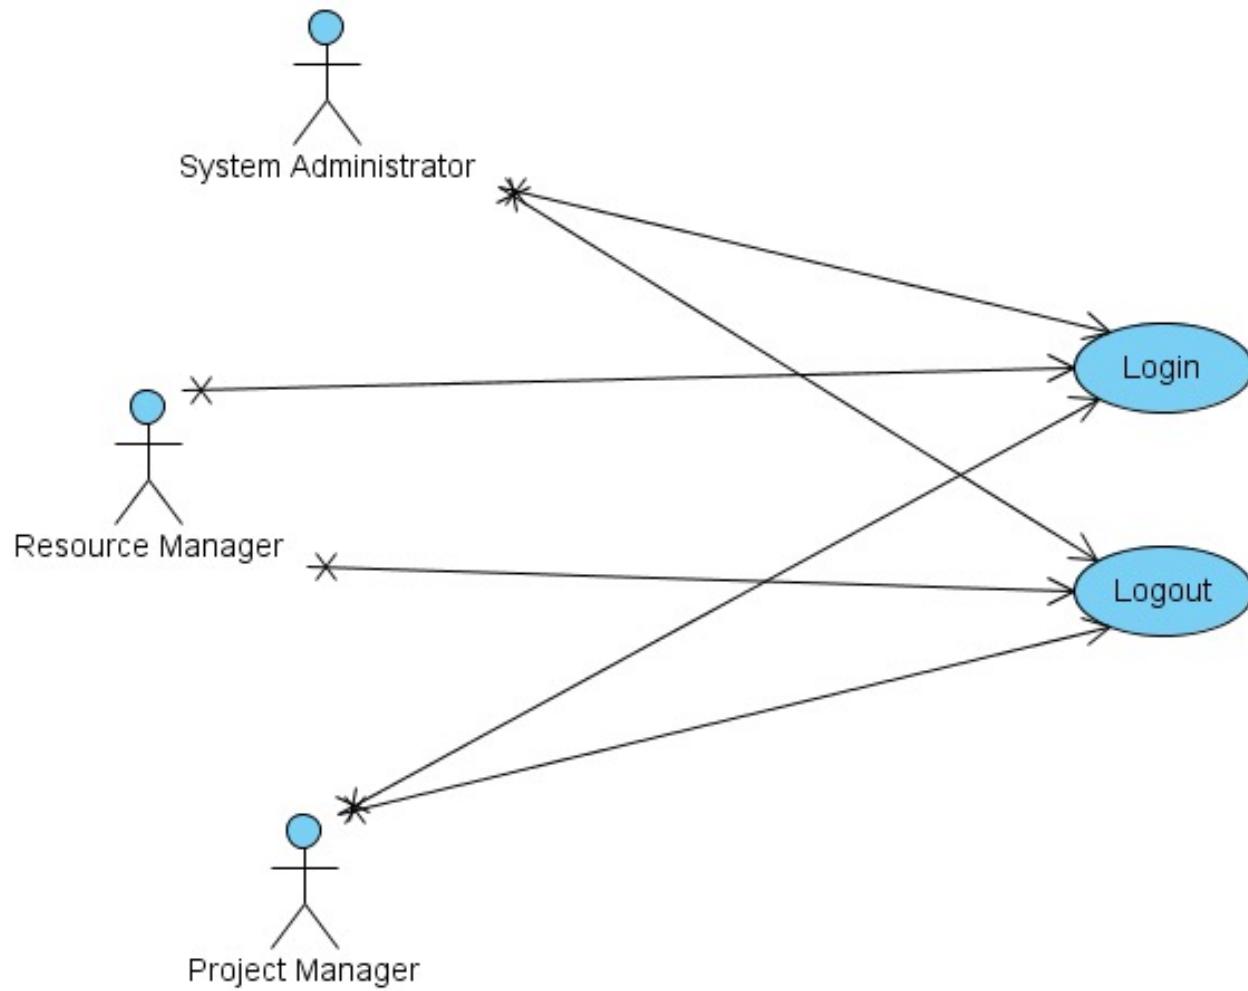

# Generalization

---

- Actor Generalization
  - Actors may be similar in how they use a system.
  
- Use case Generalization
  - Use cases may be similar in the functionality provided to users.

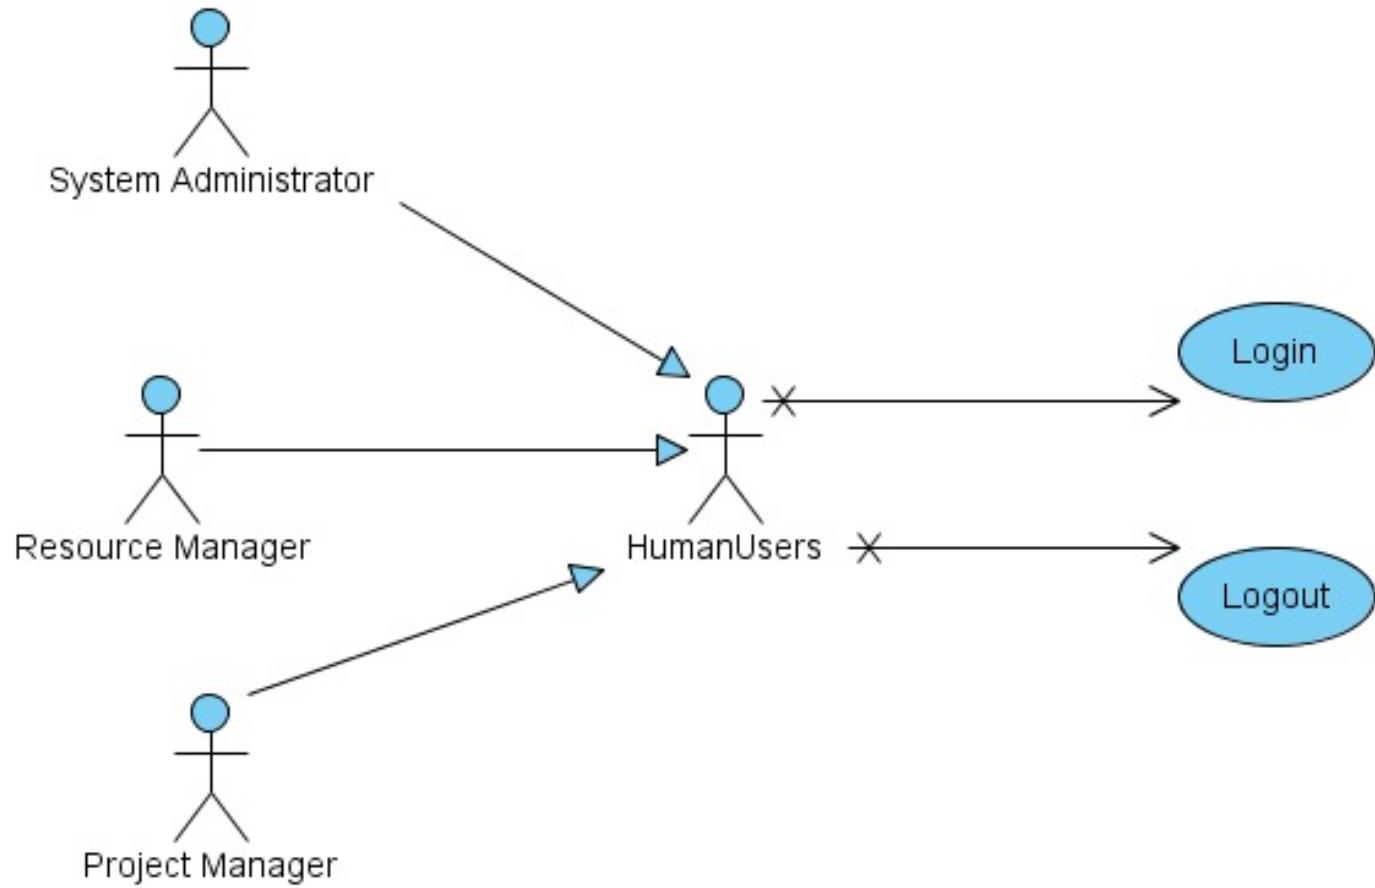

# Actor Generalization

---

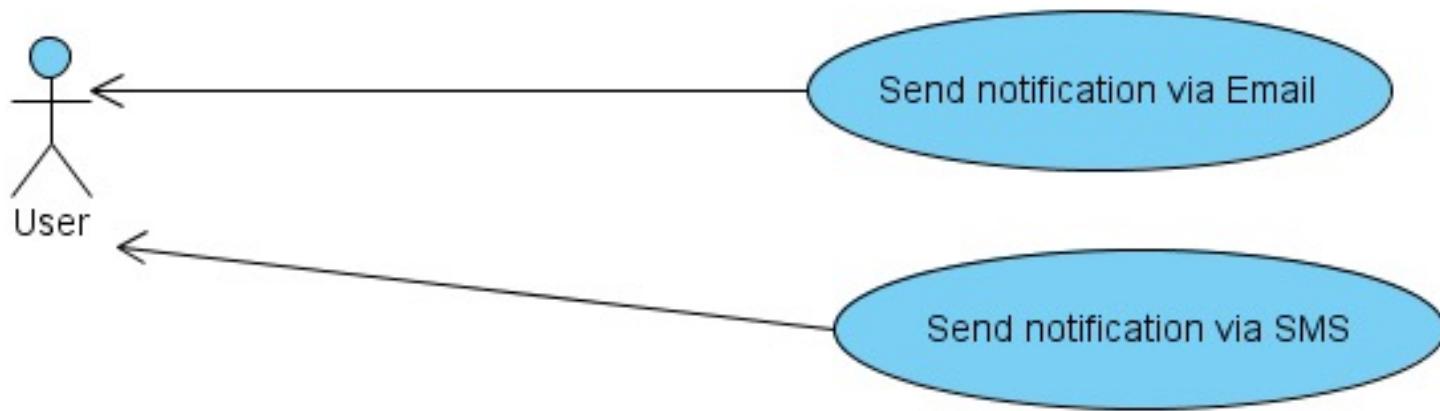

# Actor Generalization

---

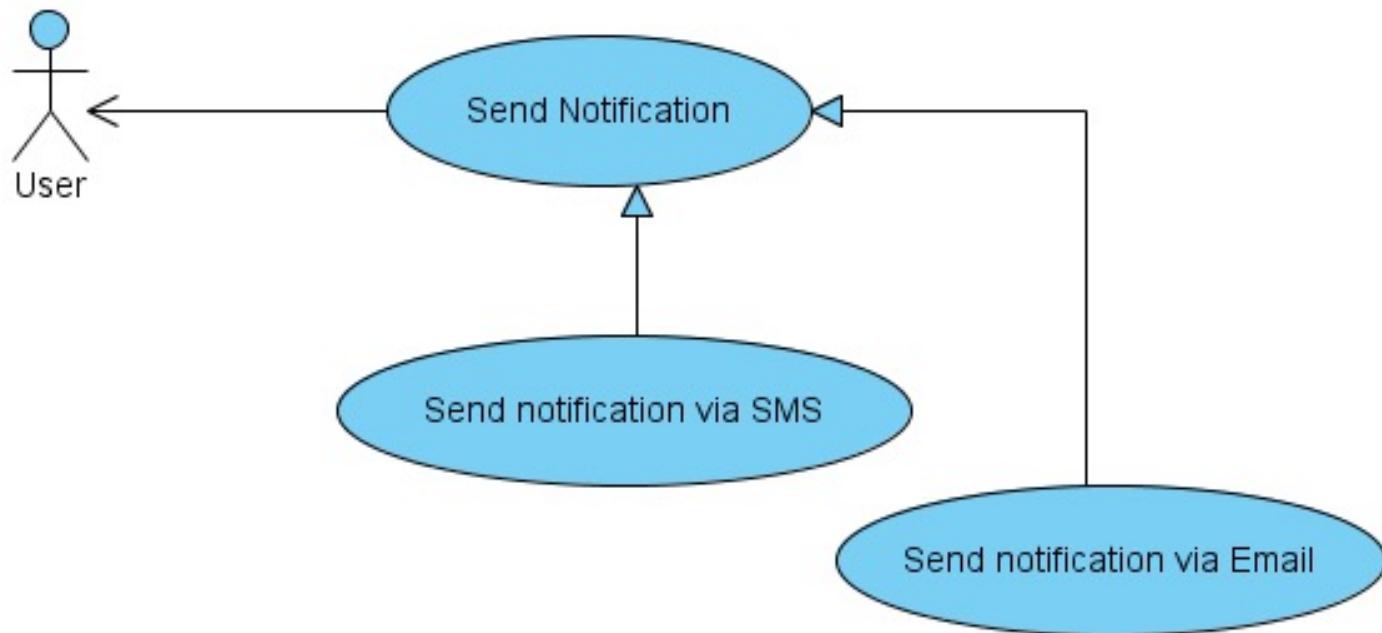

# Use Case Generalization

---

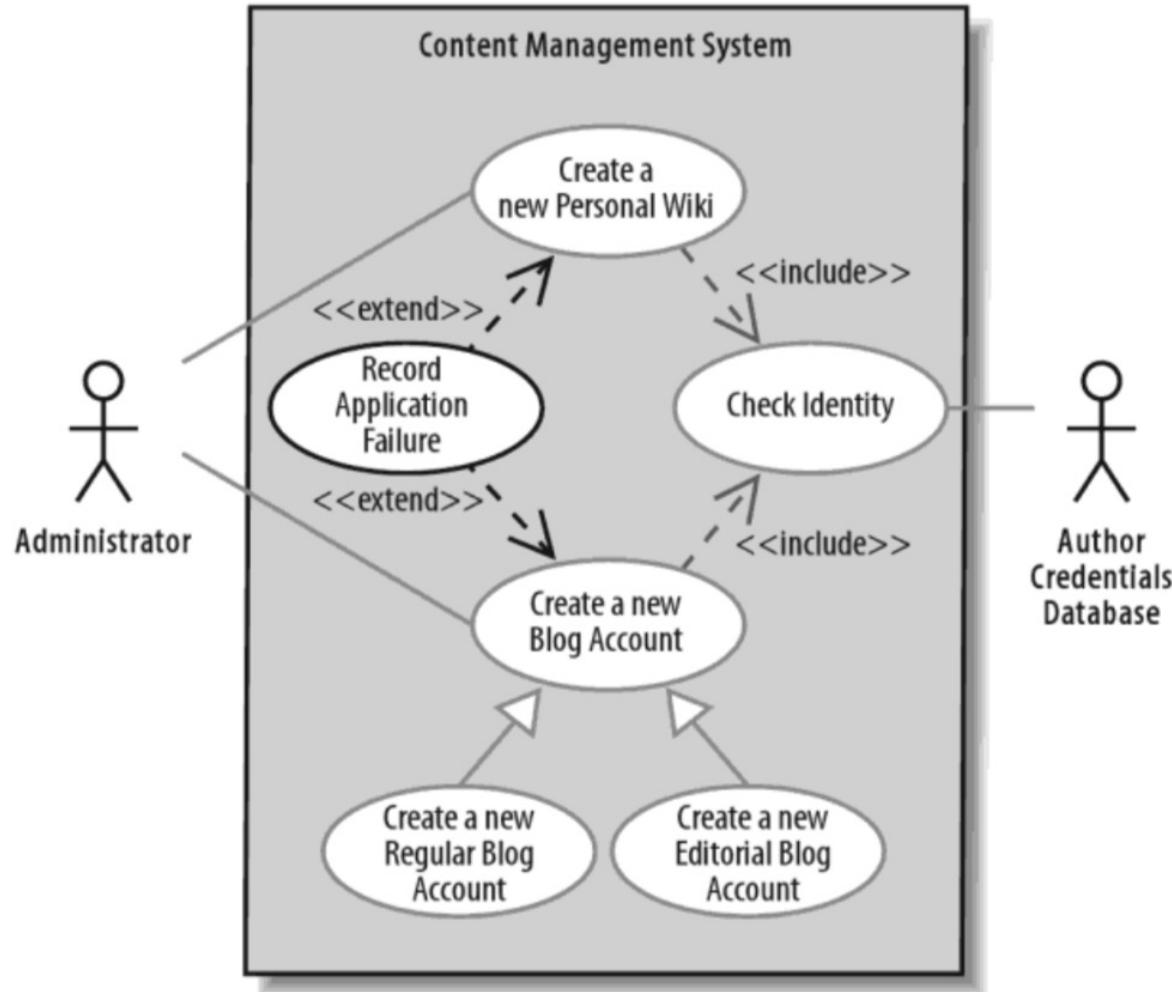

# Use Case Generalization

---

# Dependency and Generalization

# Summary

# Summary

---

- Use cases are a valuable tool to help understand the functional requirements of a system.
- A first pass at use cases should be made early on. More detailed versions of use cases should be worked just prior to developing that use case.
- It is important to remember that use cases represent an external view of the system. As such, don't expect any correlations between use cases and the classes inside the system.
